ABSTRACT

A method for providing a requestor with access to dynamic data via quasi-static data requests, comprising the steps of defining a web page, the web page including at least one dynamic element, creating an executable digital code to be run

5   on a computer and invoked at defined intervals by a scheduler component the executable code effective to create and storing a quasi-static copy of the defined web page, creating the scheduler component capable of invoking the executable code at predefined intervals, loading the executable code and the

10 scheduler component onto a platform in connectivity with a web server and with one another, invoking execution of the scheduler component, and retrieving and returning the static copy of the defined web page in response to requests for the defined web page.
